***What Should We Know About Prevented, Diagnostic, and Interventional Therapy in Coronary Artery Disease Aug 23 2020*** The mortality from ischemic heart disease has decreased in recent years. The better understanding of risk factors associated with development of coronary artery disease has significantly contributed to this decline. Improvements in medical and interventional therapy have reduced the complications associated with acute myocardial infarction as well as revascularization. After the

***introduction of imaging modalities, the noninvasive characterization of regional function, perfusion and metabolism allowed for more sophisticated tissue characterization to identify reversible dysfunction with high diagnostic and prognostic accuracy. We now can legitimately claim that computed tomography angiography (CTA) of the coronary arteries is available. In the evaluation of patients with suspected coronary artery disease, many guidelines today consider CTA an alternative to stress testing. However the nuclear technique most frequently used by cardiologists is myocardial perfusion imaging (MPI). The combination of a nuclear camera with CTA allows for the attainment of coronary anatomic, cardiac function and MPI from one piece of equipment. Assessing cardiac viability is now fairly routine with these enhancements to cardiac imaging. Traditional coronary angiography presents a variety of limitations related to image acquisition, content, interpretation, and patient safety. Barriers to such improvements include the paucity of clinical outcomes studies related to new imaging technology, the need for physician and staff member training, and the costs associated with acquiring and effectively***

**Out of Eden Nov 13 2019 In this changing world of what is deemed socially and politically "correct," polygamy is perhaps the last great taboo. Over the course of the last thousand years, monogamy - at least in name - has been the default setting for coupledness and procreation. And yet, throughout history, there have been inklings that "one-man, one-woman" may not be the most natural state-of-being for humans. The recent Ashley Madison "cheaters website" hacking, coupled with the high divorce rate of the last half-century, provide more than enough evidence to convince even a hopeless romantic that**

**monogamy, and the institution of marriage which props it up, is doomed to be a bygone remnant of a more socially conservative past. Esteemed writer and evolutionary biologist David P. Barash tackles this uncomfortable finding: that humans are actually biologically and anthropologically more inclined toward polygamy. With years of research in the field to back up this argument, Barash presents hundreds of anecdotes from both evolutionary biology and human history that guide the reader through the societal impacts of monogamy and polygamy - some expected (sexual behavior) and others unexpected (the most successful models of parenting). Despite this natural inclination of humanity, Barash is reassuring throughout this fascinating read in his resolution that "biology is not destiny."**

***Addicted to Lust* Jul 22 2020 Few cultural issues alarm conservative Protestant families and communities like the seemingly ubiquitous threat of pornography. Thanks to widespread access to the internet,**

***conservative Protestants now face a reality in which every Christian man, woman, and child with a smartphone can access limitless pornography in their bathroom, at work, or at a friend's sleepover. Once confident of their victory over pornography in society at large, conservative Protestants now fear that "porn addiction" is consuming even the most faithful. How are they adjusting to this new reality? And what are its consequences in their lives? Drawing on over 130 interviews as well as numerous national surveys, Addicted to Lust shows that, compared to other Americans, pornography shapes the lives of conservative Protestants in ways that are uniquely damaging to their mental health, spiritual lives, and intimate relationships. Samuel L. Perry demonstrates how certain pervasive beliefs within the conservative Protestant subculture unwittingly create a context in which those who use pornography are often overwhelmed with shame and discouragement, sometimes to the point of depression or withdrawal from faith altogether. Conservative Protestant women who use pornography feel a "double shame" both for sinning sexually and for sinning "like a man," while conflicts over pornography in marriages are escalated by patterns of lying,***

***Primal Loss May 20 2020 Seventy now-adult children of divorce give their candid and often heart-wrenching answers to eight questions (arranged in eight chapters, by question), including: What were the main effects of your parents' divorce on your life? What do you say to those who claim that "children are resilient" and "children are happy when their parents are happy"? What would you like to tell your parents then and now? What do you want adults in our culture to know about divorce? What role has your faith played in your healing? Their simple and poignant responses are difficult to read and yet not without hope. Most of the contributors--women and men, young and old, single and married--have never spoken of the pain and consequences of their parents' divorce until now. They have often never been asked, and they believe that no one really wants to know. Despite vastly different circumstances and details, the similarities in their testimonies are striking; as the reader will discover, the death of a child's family impacts the human heart in universal ways.***

**Speleothem Record of Southern Arizona**  
**Paleoclimate, 54 to 3.5 Ka** May 12 2022 In the semi-arid southwestern US, the lack of continuous records of climate over the last glacial cycle has precluded a complete understanding of the rates and timing of past regional changes in climate. Speleothems can provide high-resolution, continuous record of moisture, temperature, and, potentially, vegetation variations and can be precisely dated by uranium-series disequilibrium. We have produced two U-series dated speleothem delta 18O records from Cave of the Bells (COB). COB is located in Santa Cruz County, Arizona on the east side of the Santa Rita Mountains (31°45'N, 110°45'W; 1700 m). The glacial speleothem delta 18O record (53 to 8.5 ka) confirms that deglaciation in the Southwest proceeded via a stepwise shift, mirroring the Bjlling-Allerjd warming and Younger Dryas cooling, beginning around 15 ka. There is no evidence of early warming before the decline of the large ice sheets. In Marine Isotope Stage 3 (MIS3; 53 to 30 ka), we observe millennial variations similar to Dansgaard-Oeschger (DO) events first seen in Greenland ice core delta 18O records with wet/cold conditions indicated by our cave record during glacial stadials (cold periods)

**and dry/warm during glacial interstadials (warmer periods). High-resolution U-series dating allows for refinement of the timing of DO events in MIS3, and spectral analysis confirms the presence of a 1515-year climate cycle during this time. The delta 18O data from a Holocene stalagmite (6.9 to 3.5 ka) average 3‰ higher than modern and exhibit substantial multidecadal to multicentury variation. We propose that in addition to drier/warmer conditions in the winter, a stronger summer monsoon and perhaps warmer summer temperatures supplied waters with higher delta 18O values to the cave during the mid-Holocene. Spectral analysis of early part of the delta 18O record reveals variability at periods of 233 years and at 142 and 52. After 4.9 ka a prominent shift from centennial to multidecadal periods of variability (a 70 to 50-year cycle) is observed and there is a slight decrease in average delta 18O values. This shift is coincident with a hypothesized increase in El Niño activity, which is correlated to wet winters in the modern southwest, in the tropical Pacific at 5 ka.**
